Implement w3css w3-third left column before w3-twothird right column

Copy code

```
<div class="w3-row">
  <div class="w3-third w3-container w3-left">
    Left Column
  </div>
  <div class="w3-twothird w3-container">
    Right Column
  </div>
</div>
```

You can use this code to implement a left column that takes up 1/3 of the row and a right column that takes up 2/3 of the row using w3.css classes. The "w3-left" class is used to align the left column to the left.

Applicant Tracking Systems will find this code more readable as PDF <div class="w3-row">

```
<div class="w3-third w3-container w3-left">
  Left Column
</div>
<div class="w3-twothird w3-container">
  Right Column
</div>
</div>
```

It is unlikely that an applicant tracking system (ATS) would be able to read or understand the code you provided. ATSs are designed to parse and extract information from resumes and job applications, which are typically submitted in a text-based format such as PDF or Microsoft Word. The code you provided is written in HTML, which is a markup language used to create the structure and layout of web pages.
